

### An Introduction to Data Intensive Computing

Amir H. Payberah payberah@kth.se 2022-08-30

### **Course Information**

- Provide students with a solid foundation for understanding large scale distributed systems used for storing and processing massive data.
- Cover a wide variety of advanced topics in data intensive computing platforms, i.e., the frameworks to store and process big data.

### Intended Learning Outcomes (ILOs)

- ► ILO1: Understand the main concepts of data-intensive computation platforms.
- ► ILO2: Apply the grabbed knowledge to store and process massive data.
- ► ILO3: Analyze the technical merits of data-intensive computation platforms.

#### The Course Assessment

- ► Task1: the review questions.
- ► Task2: the lab assignments.
- ► Task3: the essay and the presentation.
- ► Task4: the project.
- ► Task5: the final exam.

### How Each ILO is Assessed?

|      | Task1 | Task2 | Task3 | Task4 | Task5 |
|------|-------|-------|-------|-------|-------|
| ILO1 | Х     | Х     |       |       | Х     |
| ILO2 |       | Х     |       | Х     |       |
| ILO3 |       |       | Х     |       |       |

### Task1: The Review Questions

- Five set of review questions, one set for each week.
- ► The review questions are graded P/F.
- They should be done individually.

### Task2: The Lab Assignments

- ► Four lab assignments, each focuses on a specific topic.
- ► No deadline.

### Task3: The Essay and The Presentation

- One module for each group: writing an essay and presenting it to their opponents (another group).
- Grading of this task has the following parts:
  - *E*: Essay (weight 50%)
  - P: Presentation (weight 20%)
  - Q: Reviewing essay and asking questions (weight 20%)
  - A: Answering questions (weight 10%)
- Eeach part is graded A-F.
- The final grade is computed as  $0.5 \times E + 0.2 \times P + 0.2 \times Q + 0.1 \times A$ .

#### Task4: The Final Project

- One final project: source code and oral presentation.
- Proposed by students and confirmed by the teacher.
- They should be done in group.

### Task5: The Final Exam

- ▶ The final exam covers all the modules presented during the course
- ► It is graded A-F.

- ► To pass the course: you must pass Task 1 and get at least E in Task 3, Task 4, and Task 5.
- The final grade of the course is computed as  $0.3 \times Task3 + 0.3 \times Task4 + 0.4 \times Task5$ .

"Why is an A or B better than a C or D? Aren't all letters equal in the eyes of God?"

### How to Submit the Assignments?

- ► Through Canvas.
- ► You will work individually on Task 1 and Task 5.
- ► You will work in groups of three on Task 3 and Task 4.

### The Course Material

- Mainly based on research papers.
- ▶ We also cover the following books.

#### The Course Web Page

### The Course Overview

### Cloud Computing and Big Data

- ► The main trends:
  - Computers not getting any faster
  - Internet connections getting faster
  - More people connected to the Internet
- Conclusion: move the computation and storage of big data to the cloud!

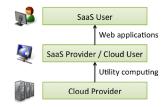

# **Cloud Computing**

### Cloud Computing Definition

- Cloud Computing refers to both:
  - 1. The applications delivered as services over the Internet
  - 2. The hardware and systems software in the datacenters that provide those services
- ► The services: called Software as a Service (SaaS)
- ► The datacenter hardware and software is called cloud

- ► The NIST definition:
  - Five characteristics
  - Three service models
  - Four deployment models

#### National Institute of Standards and Technology

Technology Administration, U.S. Department of Commerce

### **Cloud Characteristics**

### **Cloud Characteristics**

[http://aka.ms/532]

► A consumer can independently provision computing capabilities without human interaction with the service provider.

On-demand self-service

### Cloud Characteristics - Ubiquitous Network Access

- Available over the network
- Accessed through mobile phones, laptops, ...

Ubiquitous network access

### Cloud Characteristics - Resource Pooling

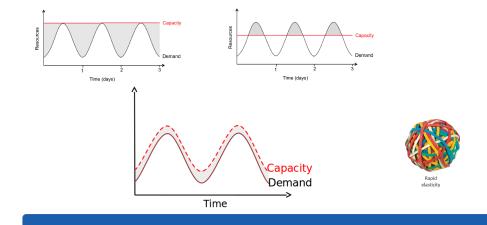

- Provider's computing resources are pooled to serve consumers
- Location transparent

Location transparent resource pooling

► Capabilities can be rapidly and elastically provisioned, in some cases automatically.

### Cloud Characteristics - Measured Service

Resource usage can be monitored, controlled, and reported providing transparency for both the provider and consumer.

Measured service with pay per use

## **Cloud Service Models**

### **Cloud Service Models**

[http://aka.ms/532]

 Assume, you just moved to a city and you are looking for a place to live.

- ► What is your choice?
  - Build a new house?
  - Buy an empty house?
  - Live in a hotel?

- Let's build a new house!
- You can fully control everything you like your new house to have.
- But that is a hard work.

- What if you buy an empty house?
- You can customize some part of your house.
- But never change the original architecture.

- How about living in a hotel?
- Living in a hotel will be a good idea if the only thing you care is about enjoying your life.
- There is nothing you can do with the house except living in it.

# Let's translate it to Cloud Computing

- ► Infrastructure as a Service (laaS): similar to building a new house.
- ► Platform as a Service (PaaS): similar to buying an empty house.
- ► Software as a Service (SaaS): similar to living in a hotel.

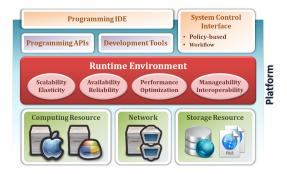

- ► Vendor provides resources, e.g., processing, storage, network, ...
- Consumer is provided customized virtual machines.
- ► Example: Amazon Web Services (EC2 instances and S3 storage)

- ► Vendor provides hardware and development environment.
- Example: Google app engine

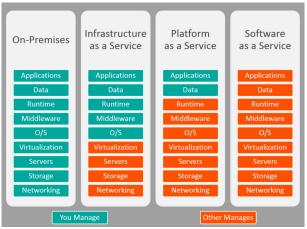

- ▶ Vendor provides applications accessed over the network.
- ► Example: Gmail, Github

#### IaaS - PaaS - SaaS

# **Deployment Models**

# Deployment Models

[https://goo.gl/fWmcGK]

# Public Cloud Infrastructure Vendors

- Amazon Web Services (AWS)
- Microsoft Azure
- Google Cloud Platform
- IBM Bluemix

...

## Main Services

- ► Computing
- ► Storage
- Database
- Big data analytics
- ► ...

# Computing Services

VIDTUAL MACHINE

- Virtual machines
- Container services
- Serverless compute

VIRTUAL MACHINES

CONTAINERS

## **Storage Services**

- ► Relational Database Management Services (RDBMS)
- NoSQL databases
- In-Memory data services

# Big Data Analytics

- Big Data Managed Cluster-as-a-Service
- Data warehouse
- Data streaming
- Data queuing

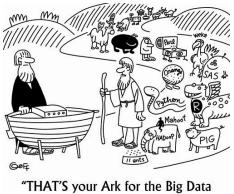

# Big Data

#### "THAT'S your Ark for the Big Data flood? Noah, you will need a lot more storage space!"

[https://www.kdnuggets.com/2012/12/cartoon-preparing-for-big-data-flood.html]

## What is Big Data?

[https://www.sue-anderson.com.au/index.php/2017/08/18/cursing-curious-work]

# Big data is the data characterized where attributes: volume, variety, velocity and value.

# Big Data in Simple Words

## Small Data is when is fit in RAM. Big Data is when is crash because is not fit in RAM.

2/6/13, 8:22 AM

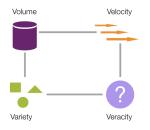

# The Four Dimensions of Big Data

- Volume: data size
- Velocity: data generation rate
- ► Variety: data heterogeneity
- This 4th V is for Vacillation: Veracity/Variability/Value

#### **Big Data Sources**

#### How Much Data?

# How To Store and Process Big Data?

- ► Traditional platforms fail to show the expected performance.
- ▶ Need new systems to store and process large-scale data

# Scale Up vs. Scale Out (1/2)

- Scale up or scale vertically: adding resources to a single node in a system.
- ► Scale out or scale horizontally: adding more nodes to a system.

# Scale Up vs. Scale Out (2/2)

- Scale up: more expensive than scaling out.
- ► Scale out: more challenging for fault tolerance and software development.

# Big Data Stack

|  | Dat   | a Processing  |   |  |  |  |  |  |

| Resource Management  |       |   |   |  |  |  |  |  |
| Mesos, YARN  |       |   |   |  |  |  |  |  |

#### Resource Management

- Manage resources of a cluster
- Share them among the platforms
- ► Mesos, YARN, Borg, ...

# Data Storage - Distributed File Systems

- Store and retrieve files on/from distributed disks
- ► GFS, HDFS, FlatFS, ...

#### Data Storage - NoSQL Databases

- BASE instead of ACID
- ▶ BigTable, Dynamo, Cassandra, ...

# Data Storage - Messaging Systems

- Store streaming data
- ► Kafka, Flume, ActiveMQ, ...

#### Data Processing - Batch Data

- Process data-at-rest
- Data-parallel processing model
- ► MapReduce, FlumeJava, Spark, ...

## Data Processing - Streaming Data

- Process data-in-motion
- ► Storm, Flink, Spark Streaming, ...

# Data Processing - Linked Data (Graph)

- Graph-parallel processing model
- Vertex-centric and Edge-centric programming model
- ▶ Pregel, GraphLab, GraphX, ...

## Data Processing - Structured Data

- ► Take advantage of schemas in data to process
- ► Hive, Spark SQL, ...

# Data Processing - Machine Learning

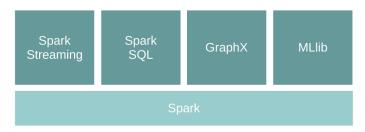

- ▶ Data analysis, e.g., supervised and unsupervised learning
- ▶ Mahout, TensorFlow, MLlib, ...

## Spark Processing Engine

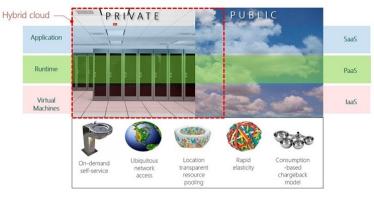

# Summary
