## The Questions-Answers Page

<https://tinyurl.com/bdenpwc5>

# Where Are We?

# Stream Processing (1/3)

- ▶ **Stream processing** is the act of **continuously** incorporating **new data** to compute a result.

# Stream Processing (2/3)

- ▶ The **input data** is **unbounded**.
  - A **series of events**, no predetermined **beginning or end**.
  - E.g., credit card transactions, clicks on a website, or sensor readings from IoT devices.

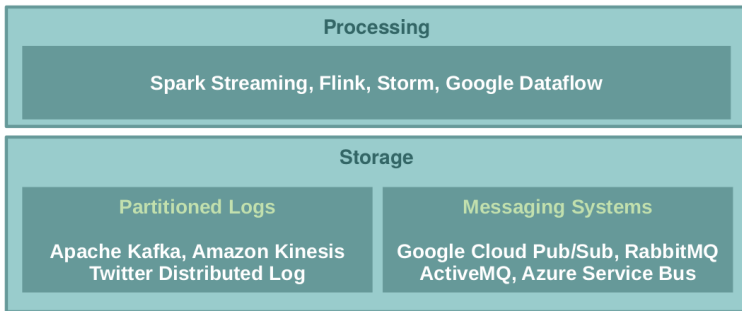

## Stream Processing (3/3)

- ▶ Database Management Systems (DBMS): **data-at-rest** analytics
  - Store and index data before processing it.
  - Process data only when explicitly asked by the users.
- ▶ Stream Processing Systems (SPS): **data-in-motion** analytics
  - Processing information as it flows, without storing them persistently.

# Stream Processing Systems Stack

# Data Stream Storage

# The Problem

- ▶ We need disseminate streams of events from various producers to various consumers.

## Data Producers

## Data Consumers

## Possible Solution?

- ▶ Messaging systems

Message

[www.defit.org](http://www.defit.org)

# What is Messaging System?

- ▶ **Messaging system** is an approach to **notify consumers** about new events.
- ▶ **Messaging systems**
  - **Direct** messaging
  - Message **brokers**

## Direct Messaging (1/2)

- ▶ Necessary in **latency critical** applications (e.g., remote surgery).
- ▶ A **producer** sends a message containing the event, which is **pushed** to **consumers**.
- ▶ Both consumers and producers have to be **online at the same time**.

## Direct Messaging (2/2)

- ▶ What happens if a **consumer crashes** or temporarily **goes offline**? (**not durable**)
- ▶ What happens if **producers** send messages **faster** than the **consumers** can process?
  - **Dropping** messages
  - **Backpressure**
- ▶ We need **message brokers** that can **log events** to process at a **later time**.

# Message Broker

[<https://bluesyemre.com/2018/10/16/thousands-of-scientists-publish-a-paper-every-five-days>]

# Message Broker

- ▶ A **message broker** decouples the **producer-consumer** interaction.
- ▶ It runs as a **server**, with **producers and consumers** connecting to it as **clients**.
- ▶ **Producers** write messages to the broker, and **consumers** receive them by reading them from the broker.
- ▶ **Consumers** are generally **asynchronous**.

## Partitioned Logs

- ▶ In typical message brokers, once a message is **consumed**, it is **deleted**.
- ▶ **Log-based message brokers** **durably** store all events in a sequential **log**.
- ▶ A **log** is an **append-only** sequence of records on **disk**.
- ▶ A **producer** sends a message by **appending** it to the end of the log.
- ▶ A **consumer** receives messages by reading the log **sequentially**.

# Kafka - A Log-Based Message Broker

# Kafka (1/5)

- ▶ Kafka is a distributed, topic oriented, partitioned, replicated commit **log service**.

## Kafka (2/5)

- ▶ Kafka is a **distributed**, topic oriented, partitioned, replicated commit **log service**.

## Kafka (3/5)

- ▶ Kafka is a **distributed**, **topic oriented**, partitioned, replicated commit **log service**.

- Kafka is a **distributed**, **topic oriented**, **partitioned**, replicated commit log service.

- Kafka is a **distributed**, **topic oriented**, **partitioned**, **replicated** commit log service.

# Logs, Topics and Partition (1/6)

- ▶ Kafka is about logs.
- ▶ **Topics** are **queues**: a **stream of messages** of a **particular type**

```

jkreps-mn:~ jkreps$ tail -f -n 20 /var/log/apache2/access_log
::1 - - [23/Mar/2014:15:07:00 -0700] "GET /images/apache_feather.gif HTTP/1.1" 200 4128

```

## Logs, Topics and Partition (2/6)

- ▶ Each message is assigned a **sequential id** called an **offset**.

## Logs, Topics and Partition (3/6)

- ▶ Topics are **logical** collections of **partitions** (the **physical files**).
  - Ordered
  - Append only
  - Immutable

## Logs, Topics and Partition (4/6)

- ▶ Ordering is only **guaranteed within** a partition for a topic.
- ▶ Messages sent by a **producer** to a particular topic partition will be **appended** in the order they are sent.
- ▶ A **consumer** instance sees messages in the order they are stored in the log.

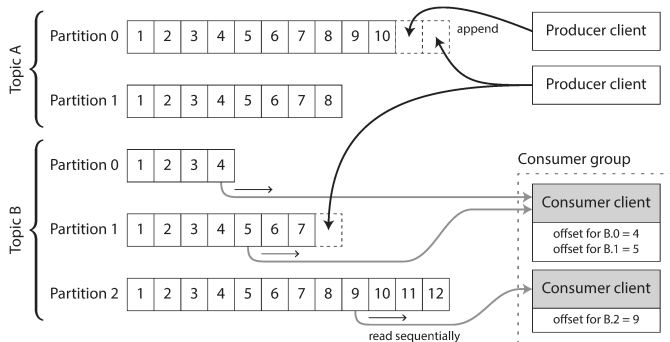

## Logs, Topics and Partition (5/6)

- ▶ Partitions of a topic are **replicated**: **fault-tolerance**
- ▶ A **broker** contains some of the **partitions** for a topic.
- ▶ One broker is the **leader** of a partition: all **writes** and **reads** must go to the leader.

# Partitioned Logs (6/6)

# Kafka Architecture

# Coordination

- ▶ Kafka uses **Zookeeper** for the following tasks:
- ▶ Detecting the **addition** and the **removal** of **brokers** and **consumers**.
- ▶ Keeping track of the **consumed** offset of each partition.

## State in Kafka

- ▶ Brokers are **stateless**: **no metadata** for consumers-producers in **brokers**.
- ▶ **Consumers** are responsible for keeping track of **offsets**.
- ▶ Messages in queues **expire** based on pre-configured time periods (e.g., once a day).

## Delivery Guarantees

- ▶ Kafka guarantees that messages from a **single partition** are delivered to a consumer **in order**.
- ▶ There is **no guarantee** on the ordering of messages coming from **different partitions**.
- ▶ Kafka only guarantees **at-least-once** delivery.

# Start and Work With Kafka

```
# Start the ZooKeeper
```

```
zookeeper-server-start.sh config/zookeeper.properties
```

```
# Start the Kafka server
```

```
kafka-server-start.sh config/server.properties
```

```
# Create a topic, called "avg"
```

```
kafka-topics.sh --create --topic avg --bootstrap-server localhost:9092 --replication-factor 1  
--partitions 1
```

```
# Produce messages and send them to the topic "avg"
```

```
kafka-console-producer.sh --topic avg --bootstrap-server localhost:9092
```

```
# Consume the messages sent to the topic "avg"
```

```
kafka-console-consumer.sh --topic avg --from-beginning --bootstrap-server localhost:9092
```

# Data Stream Processing

# Streaming Data

- ▶ **Data stream** is **unbound data**, which is broken into a **sequence of individual tuples**.
- ▶ A data **tuple** is the **atomic** data item in a data stream.
- ▶ Can be **structured**, **semi-structured**, and **unstructured**.

# Streaming Data Processing Design Points

- ▶ Continuous vs. micro-batch processing
- ▶ Record-at-a-Time vs. declarative APIs
- ▶ Event time vs. processing time
- ▶ Windowing

# Streaming Data Processing Design Points

- ▶ Continuous vs. micro-batch processing
- ▶ Record-at-a-Time vs. declarative APIs
- ▶ Event time vs. processing time
- ▶ Windowing

# Streaming Data Processing Patterns

## ▶ Micro-batch systems

- Batch engines
- Slicing up the unbounded data into a sets of bounded data, then process each batch.

## ▶ Continuous processing-based systems

- Each node in the system continually listens to messages from other nodes and outputs new updates to its child nodes.

# Streaming Data Processing Design Points

- ▶ Continuous vs. micro-batch processing
- ▶ Record-at-a-Time vs. declarative APIs
- ▶ Event time vs. processing time
- ▶ Windowing

## Record-at-a-Time vs. Declarative APIs

- ▶ **Record-at-a-Time** API (e.g., Storm)
  - Low-level API
  - Passes **each event** to the **application** and let it react.
  - Useful when applications need **full control** over the processing of data.
  - **Complicated factors**, such as maintaining state, are **governed by the application**.
- ▶ **Declarative** API (e.g., Spark streaming, Flink, Google Dataflow)
  - Applications specify **what** to compute **not how** to compute it in response to **each new event**.

# Streaming Data Processing Design Points

- ▶ Continuous vs. micro-batch processing
- ▶ Record-at-a-Time vs. declarative APIs
- ▶ Event time vs. processing time
- ▶ Windowing

## Event Time vs. Processing Time (1/2)

- ▶ **Event time:** the time at which events **actually occurred**.
  - Timestamps inserted into each record **at the source**.
- ▶ **Processing time:** the time when the record is **received at the streaming application**.

## Event Time vs. Processing Time (2/2)

- ▶ Ideally, event time and processing time should be equal.
- ▶ Skew between event time and processing time.

[<https://www.oreilly.com/ideas/the-world-beyond-batch-streaming-101>]

# Streaming Data Processing Design Points

- ▶ Continuous vs. micro-batch processing
- ▶ Record-at-a-Time vs. declarative APIs
- ▶ Event time vs. processing time
- ▶ **Windowing**

## Windowing (1/2)

- ▶ **Window**: a **buffer** associated with an input port to retain previously **received tuples**.
- ▶ **Four** different windowing **management policies**.
  - **Count-based policy**: the **maximum number** of tuples a window buffer can hold
  - **Delta-based policy**: a **delta threshold** in a tuple attribute
  - **Punctuation-based policy**: a **punctuation** is received
  - **Time-based policy**: based on **processing or event time** period

## Windowing (2/2)

▶ Two types of windows: **tumbling** and **sliding**

▶ **Tumbling window**: supports **batch** operations.

- When the buffer fills up, **all** the tuples are **evicted**.

▶ **Sliding window**: supports **incremental** operations.

- When the buffer fills up, **older** tuples are **evicted**.

## Windowing by Processing Time

- ▶ The system **buffers up** incoming data into windows until **some amount of processing time** has passed.
- ▶ E.g., **five-minute** fixed windows

[<https://www.oreilly.com/ideas/the-world-beyond-batch-streaming-101>]

## Windowing by Event Time

- ▶ Reflect the **times** at which **events** actually happened.
- ▶ Handling **out-of-order** events.

[<https://www.oreilly.com/ideas/the-world-beyond-batch-streaming-101>]

## Windowing by Event Time - Watermark (1/2)

- ▶ **Watermarking** helps a stream processing system to deal with **lateness**.
- ▶ Watermarks **flow as part of the data stream** and carry a **timestamp  $t$** .
- ▶ A watermark is a **threshold** to specify **how long the system waits for late events**.
- ▶ Streaming systems uses **watermarks** to **measure progress in event time**.

## Windowing by Event Time - Watermark (2/2)

- ▶ A  $W(t)$  declares that **event time** has reached time  $t$  in that stream
  - There should be **no more elements from the stream** with a timestamp  $t' \leq t$ .
- ▶ It is possible that certain elements will **violate the watermark condition**.
  - After the  $W(t)$  has occurred, more elements with timestamp  $t' \leq t$  will occur.
- ▶ If an arriving event lies **within the watermark**, it gets used to update a query.
- ▶ Streaming programs may explicitly expect some **late elements**.

# Streaming Data Processing Model

# Streaming Data Processing

- ▶ The tuples are processed by the application's **operators** or **processing element (PE)**.
- ▶ A **PE** is the **basic functional unit** in an application.
  - A PE processes **input** tuples, applies a **function**, and **outputs** tuples.
  - A **set of PEs** and stream **connections**, organized into a **data flow graph**.

## PEs States (1/3)

- ▶ A PE can either **maintain internal state** across tuples while processing them, or process tuples **independently** of each other.
- ▶ **Stateful** vs. **stateless** tasks

## PEs States (2/3)

- ▶ **Stateless** tasks: do **not maintain state** and process each tuple **independently** of **prior history**, or even from the **order** of arrival of tuples.
- ▶ Easily **parallelized**.
- ▶ **No synchronization**.
- ▶ **Restart upon failures** without the need of any recovery procedure.

## PEs States (3/3)

- ▶ **Stateful** tasks: involves **maintaining** information **across different tuples** to detect complex patterns.
- ▶ A **PE** is usually a **synopsis** of the **tuples** received so far.
- ▶ A subset of **recent tuples** kept in a **window buffer**.

# Job and Job Management

- ▶ At runtime, an **application** is represented by **one or more jobs**.
- ▶ **Jobs** are deployed as a **collection of PEs**.
- ▶ **Job management** component must **identify and track** individual **PEs**, the **jobs** they belong to, and associate them with the user that instantiated them.

## Logical Plan vs. Physical Plan (1/2)

- ▶ **Logical plan:** a data flow graph, where the **vertices** correspond to **PEs**, and the **edges** to **stream connections**.
- ▶ **Physical plan:** a data flow graph, where the **vertices** correspond to OS **processes**, and the **edges** to **transport connections**.

## Logical Plan vs. Physical Plan (2/2)

Logical plan

Different physical plans

# Parallelization

- ▶ How to **scale** with increasing the **number queries** and the **rate of incoming events**?
- ▶ **Three** forms of parallelisms.
  - **Pipelined** parallelism
  - **Task** parallelism
  - **Data** parallelism

# Pipelined Parallelism

- ▶ Sequential stages of a computation execute **concurrently** for **different data items**.

# Task Parallelism

- Independent processing stages of a larger computation are executed **concurrently** on the same or distinct data items.

# Data Parallelism (1/2)

- ▶ The same computation takes place **concurrently** on **different data items**.

## Data Parallelism (2/2)

- ▶ How to **allocate** data items to each **computation** instance?

# Summary

## Summary

- ▶ Messaging system and partitioned logs
- ▶ Decoupling producers and consumers
- ▶ Kafka: distributed, topic oriented, partitioned, replicated log service
- ▶ Logs, topics, partition
- ▶ Kafka architecture: producer, consumer, broker, coordinator

## Summary

- ▶ SPS vs. DBMS
- ▶ Data stream, unbounded data, tuples
- ▶ Event-time vs. processing time
- ▶ Micro-batch vs. continuous processing (windowing)
- ▶ PEs and dataflow
- ▶ Stateless vs. Stateful PEs
